March 22, 2010

Dear Momentive Performance Materials Customers and Distributors:

As outlined in Momentives' Change Notification Policy, I am informing you of a change in our five micron minusil filler. This filler is used in the products listed above. Our supplier of minusil filler has notified us effective immediately Momentive would receive material from the Mill Creek, OK plant. We have been using the Berkeley Springs, WV for a long time. We have used both facilities at one time in our history with this vendor. Our plans are to use both facilities for five micron minusil.

Our products will continue to meet the same physical property specifications, with the exception of color. Both Mill Creek and Berkeley Springs are producing minusil that is whiter in appearance than historical product. This results in Momentive material having a whiter appearance than current material. Momentive currently performs color testing by comparing new production to existing lab standards. These lab standards will be retained and all future production will be verified to be equivalent or lighter in color. In 1997 we notified our customers of a similar event where our minusil vendor delivered filler that made our products lighter and darker.

Effective immediately, we will implement this change in acceptable color. Distributors make sure your end-users see this change notification.

If you have questions, please contact your local Momentive Performance Material's sales representative, or me by phone 518-233-2883 or email Bernard.Powell@ge.com.

Sincerely,

Bernard L. Powell
